

SOLUTION REQUIREMENTS

Team ID: SWTID-2026-6530

Project Name: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority
1	Authentication	Users should access ServiceNow securely using their authorised credentials before submitting or processing laptop requests.	High
2	Authorization Levels	Employees can submit Standard Laptop requests. Approvers can approve requests. IT/Hardware team members can process configuration tasks.	High
3	External Interfaces	The solution should work with the ServiceNow Service Catalog and Flow Designer components used for the laptop procurement workflow.	High
4	Transactions Processing	The system should process the Standard Laptop request, approval, Catalog Task creation, and task assignment through the defined workflow.	High
5	Reporting	The system should allow users/team members to view the request and Catalog Task status, including the assigned group and configuration task status.	Medium
6	Business Rules	After the Standard Laptop request is approved, Flow Designer should automatically create a Catalog Task with the required description and assign it to the Hardware group.	High
7	Compliance to Laws or Regulations	Access to request and task information should follow the organisation's applicable IT access and data-handling policies.	Medium
8	Other	The workflow should activate only for the relevant Standard Laptop Service Catalog request and should maintain the required task information.	High

The functional requirements are based on the project workflow, where a Service Catalog request is approved and Flow Designer creates and assigns the Catalog Task to the Hardware group.

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The workflow should create the required Catalog Task promptly after the request is approved.	Task should be generated without unnecessary manual delay.
2	Scalability	The workflow should be able to handle multiple Standard Laptop requests through the Service Catalog.	Multiple requests should be processed using the same automated flow.
3	Security & Data Privacy	Only authorised users should be able to access, approve, or process request and task information.	Access should follow assigned ServiceNow roles and permissions.
4	Reliability & Availability	The automated flow should consistently create and assign the Catalog Task when the defined conditions are satisfied.	Approved Standard Laptop requests should trigger the configured flow successfully.
5	Usability & Accessibility	The Service Catalog request and task-tracking process should be simple for users to understand and use.	User should be able to place the request and check its status through ServiceNow.
6	Maintainability	The Flow Designer workflow should be easy for authorised IT administrators to maintain or update.	Flow configuration should be clearly defined and editable when business requirements change.

The NFR categories follow the template's required areas such as **Performance & Speed, Scalability, Security & Data Privacy, Reliability & Availability, Usability & Accessibility, and Other.**

Overall Solution Requirement

The solution should provide an automated and reliable workflow for **Standard Laptop procurement**, beginning with the Service Catalog request and continuing through approval, automatic Catalog Task creation, Hardware assignment, and configuration-status tracking.

The intended result is to reduce manual intervention, minimise user waiting time, and improve IT procurement efficiency.
