

## TECHNOLOGY STACK

**Team ID:** SWTID-2026-6530

**Project Name:** Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

### Technology Stack Details

| S.No | Architecture Component / Layer | Technology Chosen                   | Justification / Purpose                                                                                                                        |
|------|--------------------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Frontend / Client-Side         | <b>ServiceNow Service Catalog</b>   | Provides the user interface for employees to select and submit the Standard Laptop request.                                                    |
| 2    | Backend / Server-Side          | <b>ServiceNow Flow Designer</b>     | Automates the procurement workflow, including triggering the process after the Service Catalog request and creating the required Catalog Task. |
| 3    | Database / Data Storage        | <b>ServiceNow Platform Database</b> | Stores Service Requests, Requested Items, Catalog Tasks, approval information, and task-related data used by the workflow.                     |
| 4    | Cloud / Hosting / Deployment   | <b>ServiceNow Cloud Platform</b>    | Provides the platform environment in which the Service Catalog, Flow Designer, requests, and tasks are configured and executed.                |
| 5    | Version Control & CI/CD        | <b>ServiceNow Update Sets</b>       | Used to capture and move configuration changes between ServiceNow instances as part of development and deployment.                             |
| 6    | Third-Party APIs / Other Tools | <b>ServiceNow Flow Designer</b>     | Enables workflow automation by connecting the Service Catalog request with Catalog Task creation and Hardware group assignment.                |

### Technology Selection Summary

#### Frontend

**ServiceNow Service Catalog** is used as the user-facing interface where the Standard Laptop request is placed.

## **Backend**

**ServiceNow Flow Designer** is the main automation technology. The project documentation specifically uses Flow Designer to create a Catalog Task after the Service Catalog process and assign it to the Hardware group.

## **Database**

The **ServiceNow platform data storage** maintains the request, Requested Item, approval, and Catalog Task information required by the workflow.

## **Cloud / Deployment**

The project is implemented within the **ServiceNow platform environment**, where the Service Catalog and Flow Designer configurations are created.

## **Version Control / Deployment**

**Update Sets** can be used to capture configuration changes and transfer the project configuration between ServiceNow instances.

## **Other Tools**

**Flow Designer** provides the workflow automation required for this project, including task creation, description updates, approval conditions, and assignment-group configuration.

## **Overall Technology Architecture**

### **User / Employee**

↓

### **ServiceNow Service Catalog**

↓

### **Service Request & Approval**

↓

### **ServiceNow Flow Designer**

↓

### **Catalog Task**

↓

### **Hardware Assignment Group**

↓

### **Laptop Configuration**

The project documentation confirms that the workflow uses Service Catalog as the trigger and **Create Catalog Task** as the action, with the task assigned to the **Hardware** group.
