

PERFORMANCE TESTING

Team ID: SWTID-2026-6530

Project Name: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Flow Designer / ServiceNow platform
Type of Testing	Functional workflow verification
Target Module / API	Standard Laptop Service Catalog and Standard Laptop Task Flow
Test Environment	ServiceNow
Test Date	15 March 2026

Note: The project documentation demonstrates workflow verification in ServiceNow, but it does not specify a dedicated performance-testing tool such as JMeter, Locust or k6.

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Submit a Standard Laptop request through Service Catalog	N/A	N/A	Standard Laptop request should be created successfully.
2	Approve the Standard Laptop request	N/A	N/A	Request should be approved successfully.
3	Trigger the Standard Laptop Task Flow after approval	N/A	N/A	Flow should execute and create a Catalog Task.
4	Verify the generated Catalog Task	N/A	N/A	Task should contain the required description and be assigned to the Hardware group.

The project documentation confirms the Standard Laptop ordering process and the subsequent approval/request record verification.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	Not Measured	Not Tested	No measured performance result is provided in the project document.
2	Response Time (Max)	< 5 seconds	Not Measured	Not Tested	No maximum response-time measurement is provided.
3	Throughput (Req/sec)	To be measured	Not Measured	Not Tested	No throughput test result is documented.
4	Error Rate	< 1%	Not Measured	Not Tested	No performance-test error-rate result is documented.
5	CPU Utilization	< 80%	Not Measured	Not Tested	CPU utilization data is not provided.
6	Memory Utilization	< 80%	Not Measured	Not Tested	Memory utilization data is not provided.

The target values for response time, error rate, CPU utilization and memory utilization are taken directly from the supplied Performance Testing template.

Step 4: Observations & Analysis

The implemented solution successfully demonstrates the Standard Laptop procurement workflow using ServiceNow Flow Designer. The configured Flow creates a Catalog Task after approval, updates the task information and assigns it to the Hardware group.

The project documentation confirms that the generated Catalog Task can be opened to verify its updated status, short description and assignment group.

However, the available project documentation does not contain quantitative performance measurements such as average response time, maximum response time, throughput, CPU utilization, memory utilization or error rate. Therefore, these values should be measured using an appropriate performance-testing setup before marking the performance metrics as **Pass**.

Step 5: Screenshots / Evidence

Evidence to Attach:

1. Standard Laptop Service Catalog request screenshot.
2. Approval/request status screenshot.
3. Standard Laptop Task Flow screenshot.
4. Generated Catalog Task screenshot.
5. Hardware Assignment Group screenshot.
6. Performance-testing tool report, if available.

The supplied template specifically asks for screenshots or output from a performance-testing tool such as JMeter, Locust or k6.

Overall Testing Summary

The project workflow has been documented and functionally verified within ServiceNow. Performance-specific numerical results are **not available in the supplied project documentation**, so they should not be fabricated. Once the required performance test is executed, the actual measurements can be entered into Step 3.
